

# How to install OpenCV in windows-64 bit using MinGW and Codeblocks

## Note

*This tutorial is provided to help people struggling with the installation of opencv. If you have another system configuration or you don't want to use codeblocks, you will have to do your own research.*

## Step 1: Install minGW

Download [minGW 64bit installer](#) and follow the default configuration for the installation.

MinGW-w64 - for 32 and 64 bit Windows

A complete runtime environment for gcc

[Download Latest Version](#)  
mingw-w64-v7.0.0.zip (15.1 MB)

[Get Updates](#)

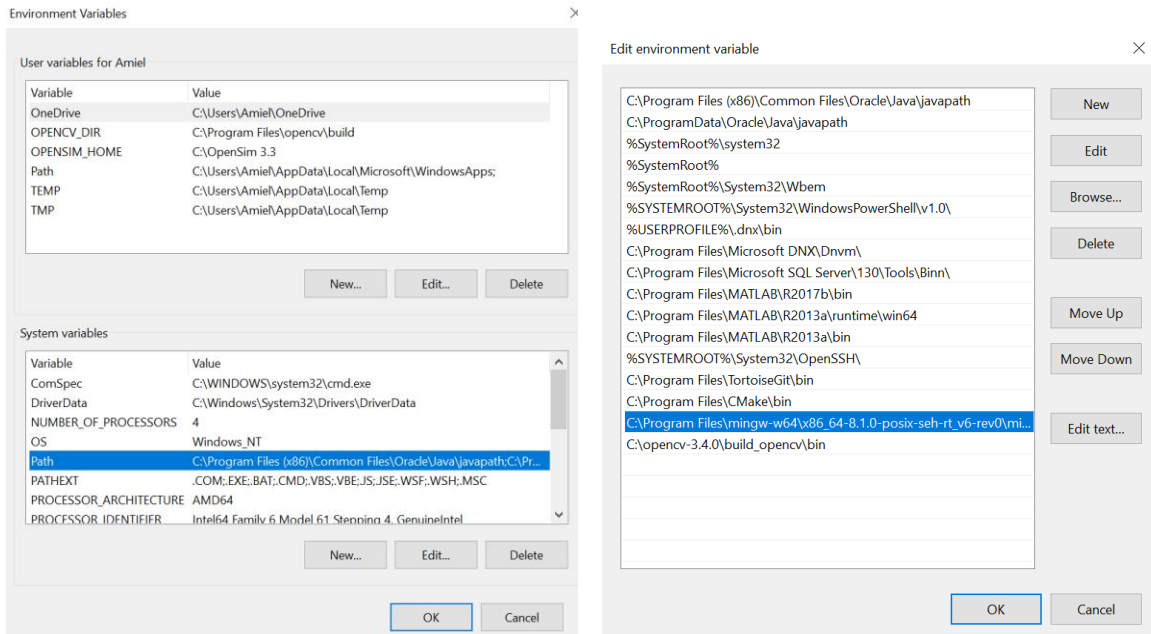

Home / Toolchains targeting Win32 / Personal Builds / mingw-builds / installer

Name	Modified	Size	Downloads / Week
<a href="#">Parent folder</a>			
<a href="#">repository.txt</a>	2018-05-24	78.2 kB	174
<a href="#">README</a>	2017-01-15	239 Bytes	18
<a href="#">mingw-w64-install.exe</a>	2017-01-15	960.5 kB	14,281

## Step 2: Add minGW to system path

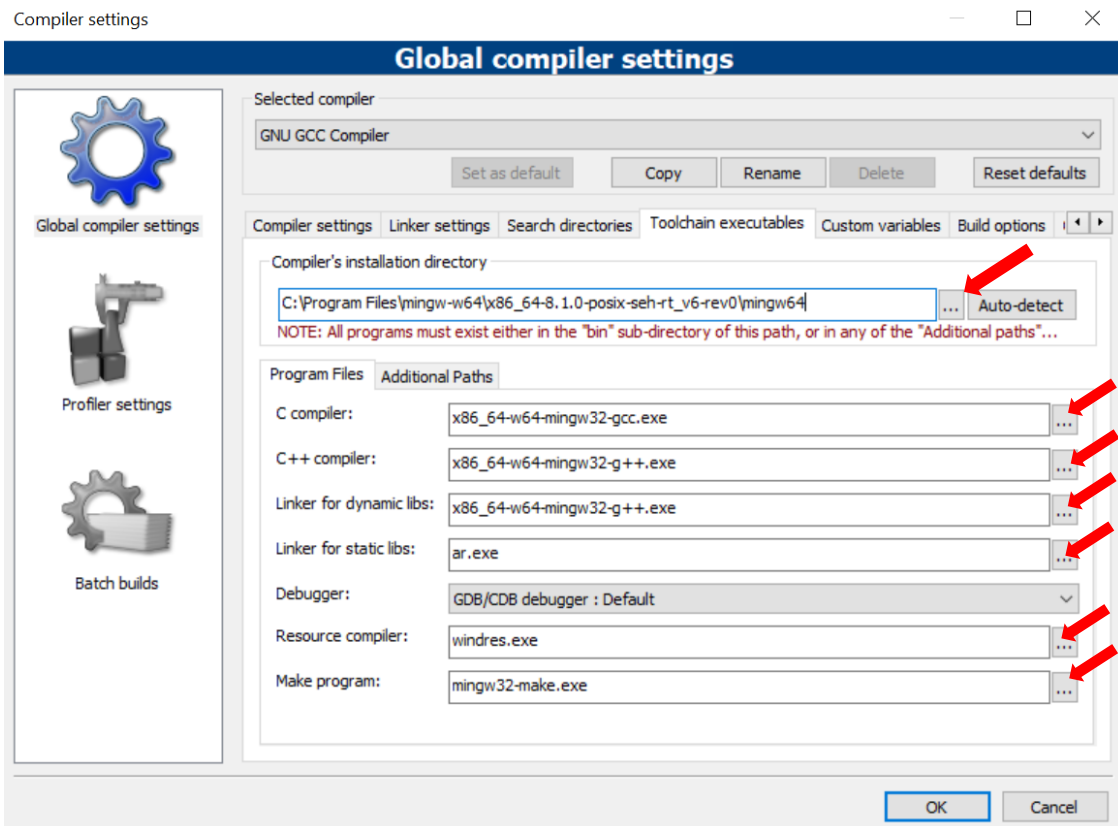

Go to Environment variables, select **path->edit->new** then add the path to **bin** folder:

C:\Program Files\mingw-w64\x86\_64-8.1.0-posix-seh-rt\_v6-rev0\mingw64\bin

### Step 3: install codeblocks

Download [codeblocks installer](#) and follow the default configuration for the installation. When the installer is finished click yes to run codeblocks, then go to Settings -> Compiler -> Toolchain Executables, and select the right directory for mingw and .exe files.

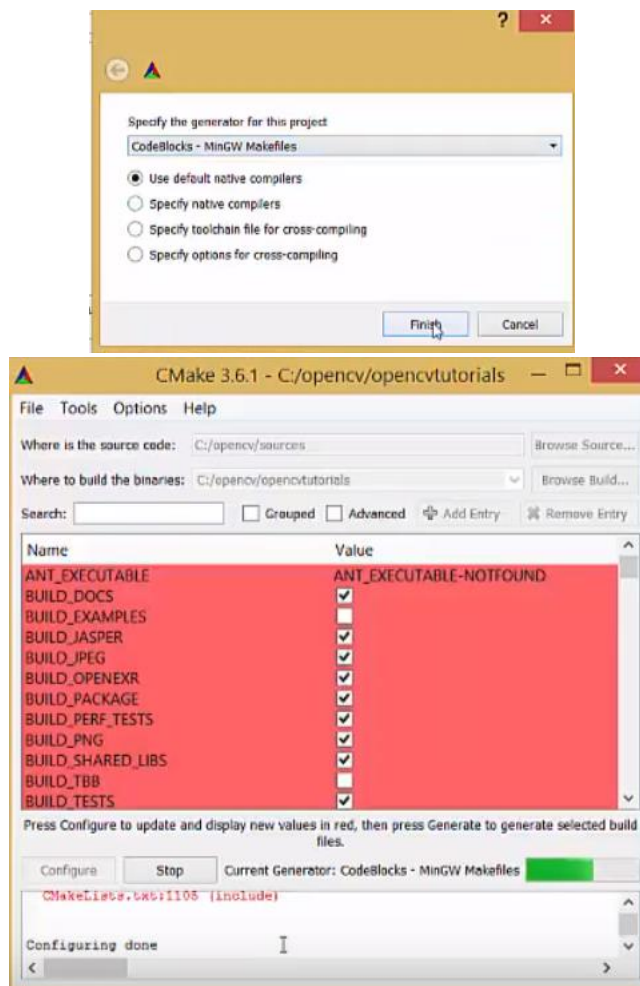

Opencv 3.4.0 is the one we use in CSGame competition for stability reasons. We had some trouble at the compilation of opencv latest version.

#### Step 4: Install opencv

Click on the OpenCV-3.4.0.exe and choose C:\ as the extract directory. OpenCV is now installed – but not configured with Codeblocks.

#### Step 5: Compiling OpenCV

First you'll need to download and install [cmake](#). Open cmake and select C:\opencv as the source directory and C:\opencv\build as the directory to build the binaries. In cmake, set ENABLE\_PRECOMPILED\_HEADERS=OFF. Press configure then generate.

You will find a codeblocks project file (opencv.cbp) in C:\opencv\build folder. Just double click it and codeblocks will load it.

Finally, from codeblocks, you just need to build it. Build target should be set to 'install' so that you can find all the binaries inside the 'install' folder of C:\opencv\build\install. Just go to 'build -> select target -> install' in the codeblocks menu and then hit 'build->build' button (Its going to take some time 2-3 hour depending on the configuration of your pc).

### Step 6: Add OpenCV to the system path

C:\opencv\build\bin (use the same process as above).

### Step 7: Run a C++ test program

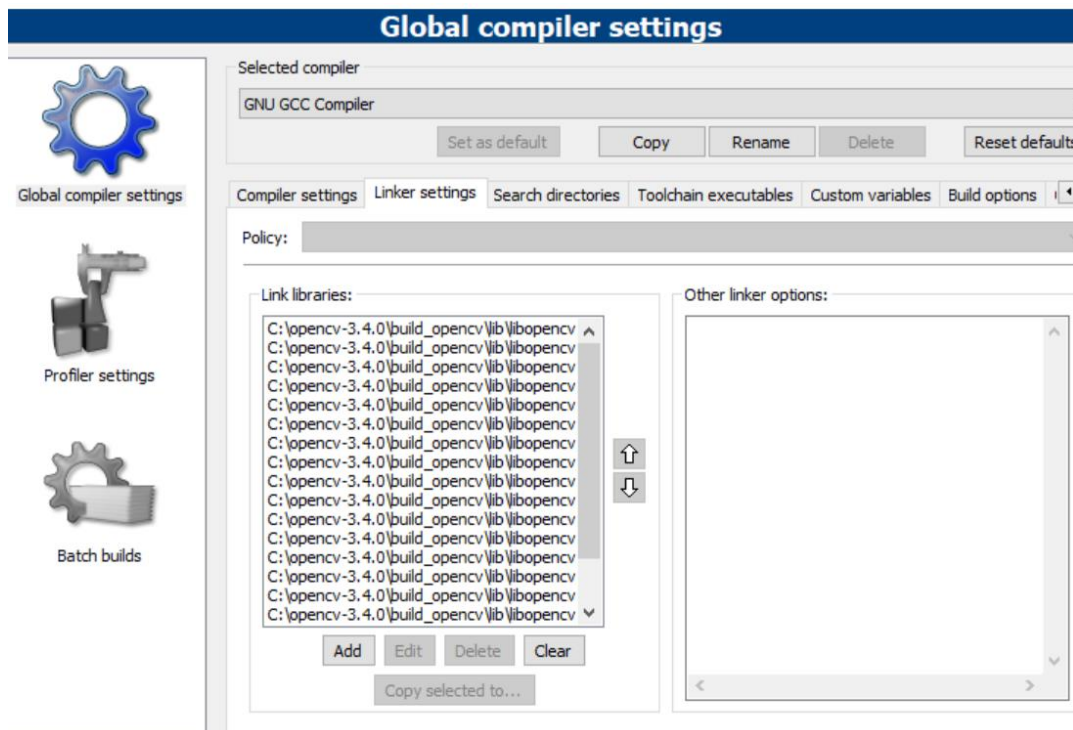

Create a test project in codeblocks.

```
#include <opencv2/opencv.hpp>
#include <iostream>

using namespace std;

int main()
{
    cout << "Hello world!" << endl;
    return 0;
}
```

Go to settings -> compiler -> Lincker setting. Add all the libraries from C:\opencv\build\lib.

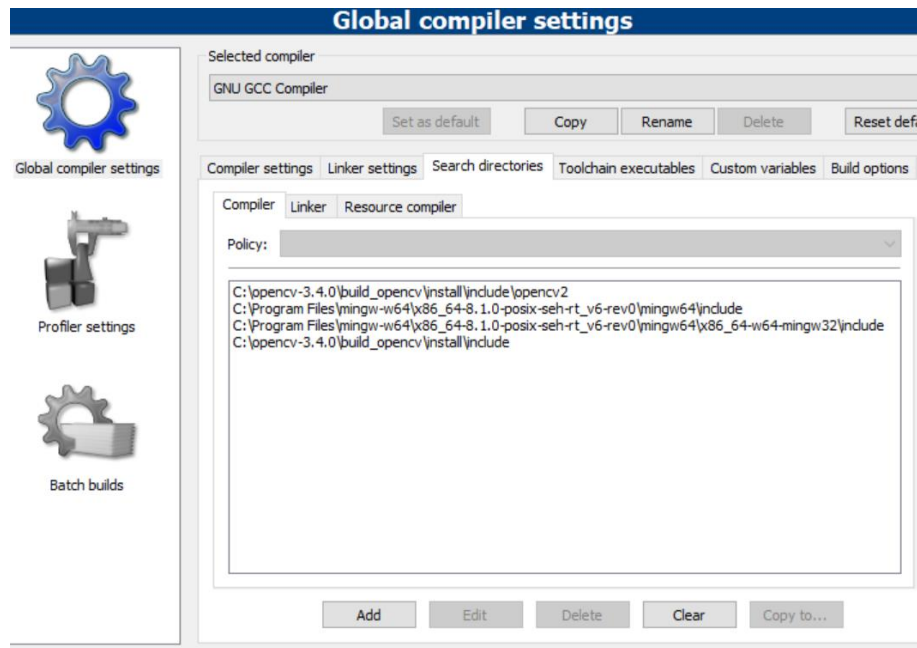

Go to settings -> compiler -> Search directories.

Add mingw64 include, search the corresponding directory in your computer.

Then add opencv include:

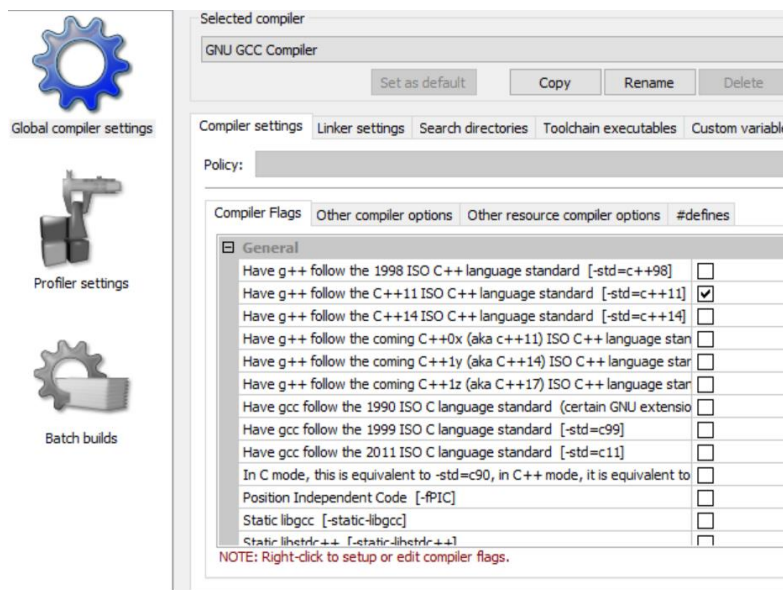

C:\opencv\build\install\include

C:\opencv\build\install\opencv2

Go to settings -> compiler -> Compiler settings. Select the following option:

Have g++ follow the C++11 ISO C++ language standard [-std=c++11] ☒

Close codeblock, and restart (important), then build and run your code.
